Goal: What sales method works best in a digital world?

About the Data Project

Context

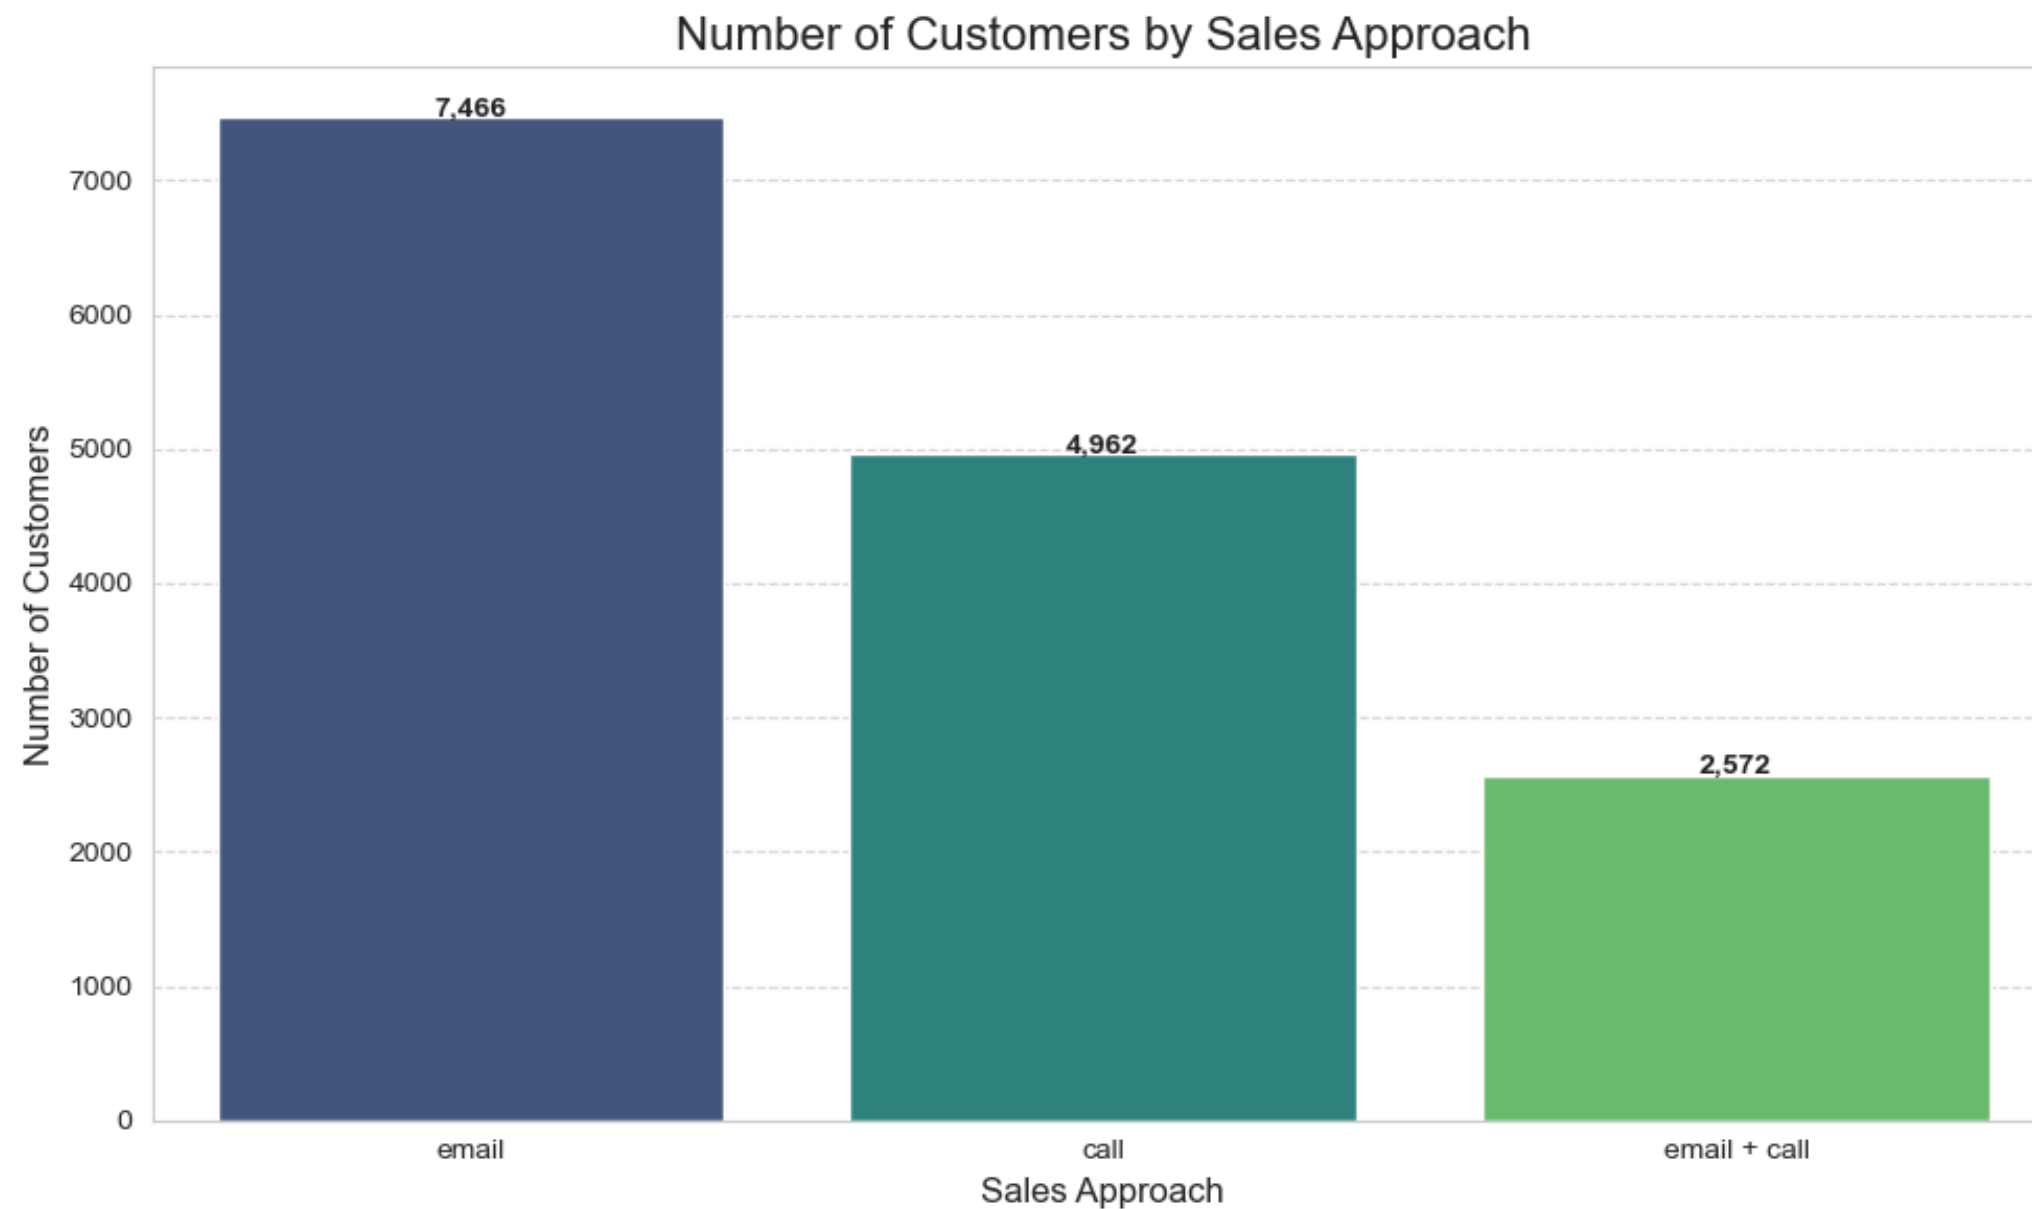

- 6 weeks sales campaign worth of information
- 3 different sales methods: Email, Call and Email + Call
- Customer tenure information
- Website traffic data

View on the future

- Understand how clients prefer to buy our products
- Revenue patterns during the campaign across sales strategies
- Is website traffic impacting on sales?
- Is customer tenure a significant factor for sales
- Is price or sales volume driving revenue?
- Other significant differences between customers in each group

Clients by Sales Strategy

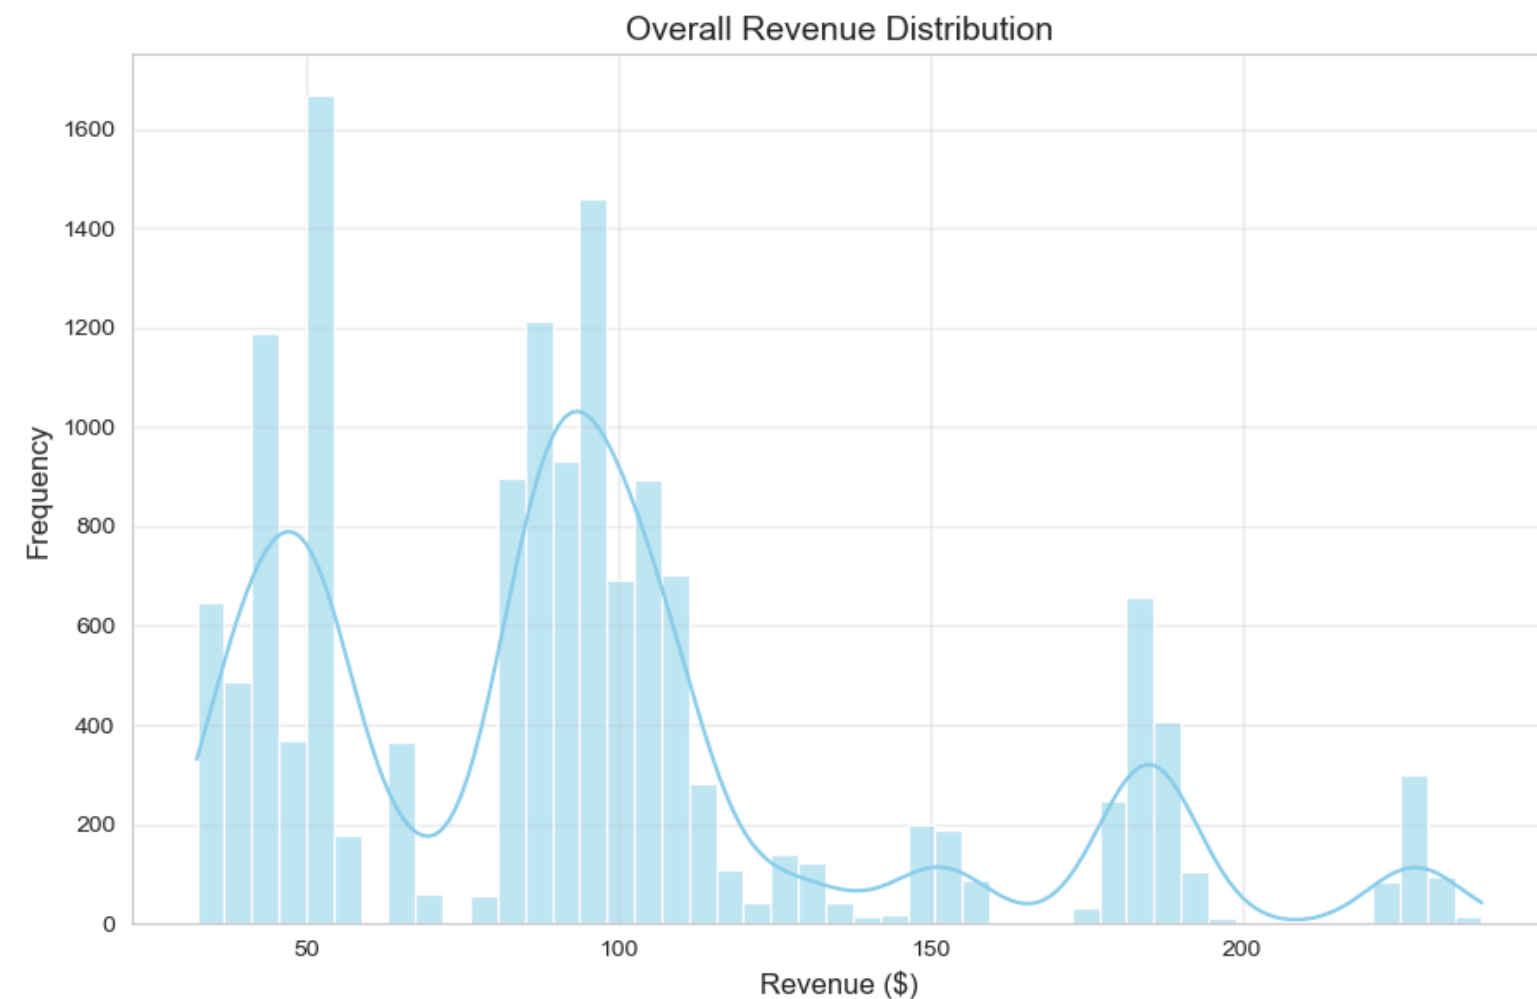

What the campaign is telling us on how customers like to buy

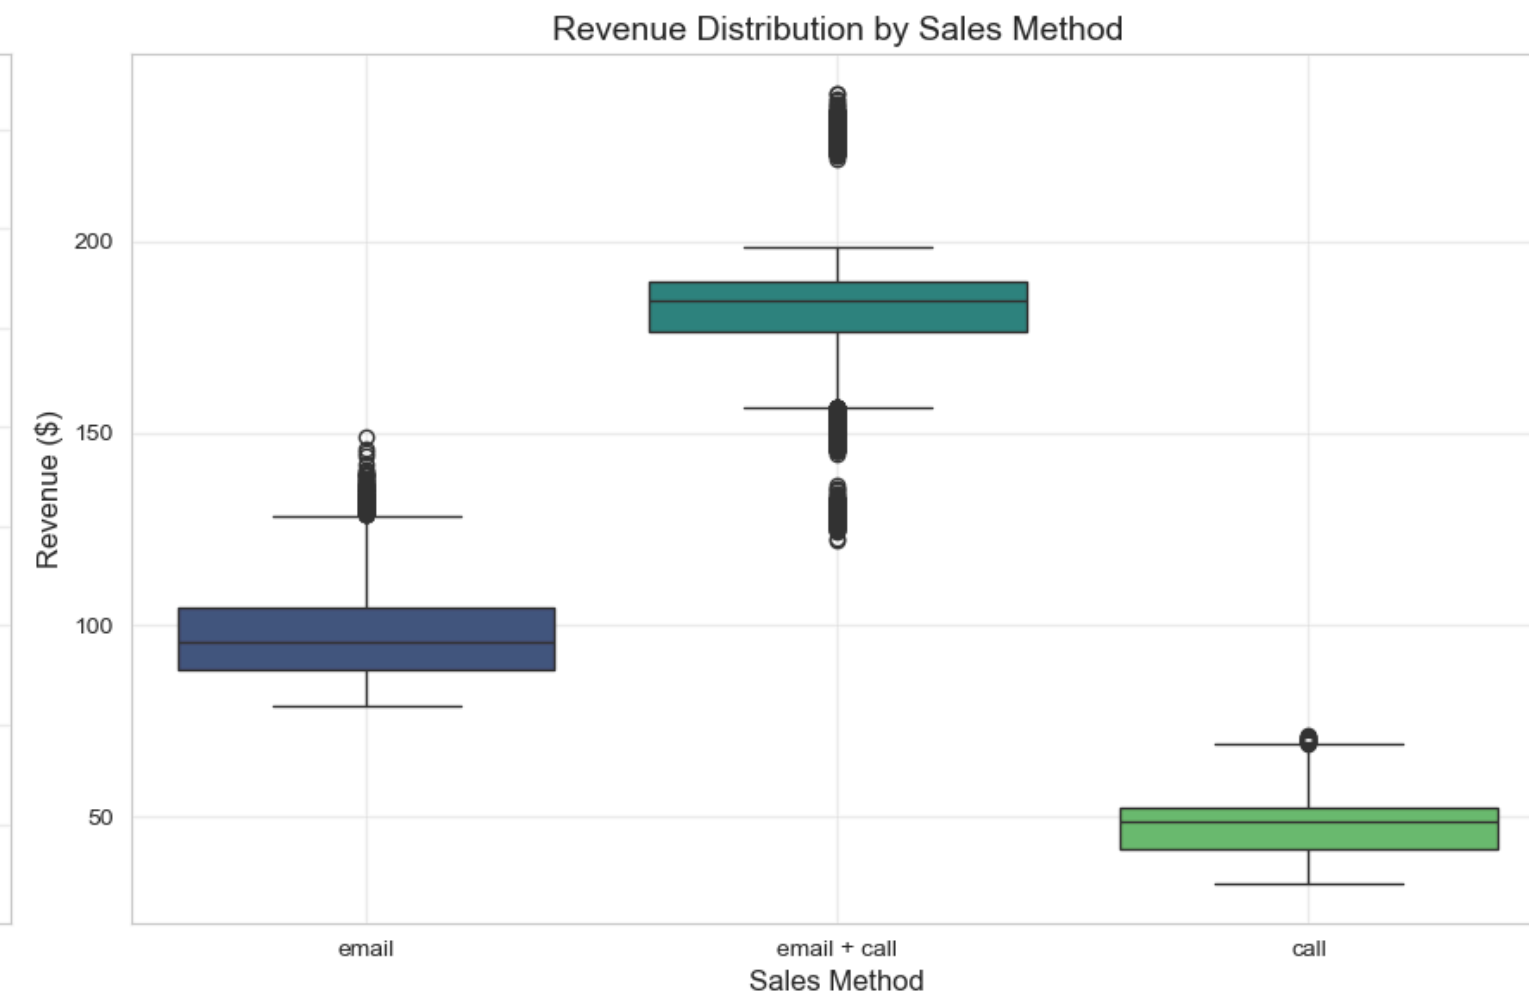

Almost half of the clients prefer **emails (~49%)**, more than a third **calls (~33%)** and less than a fifth of our clients purchased products after receiving an **email followed by a phone call (~17%)**

Revenue Spread

Can we learn anything from the revenue spread?

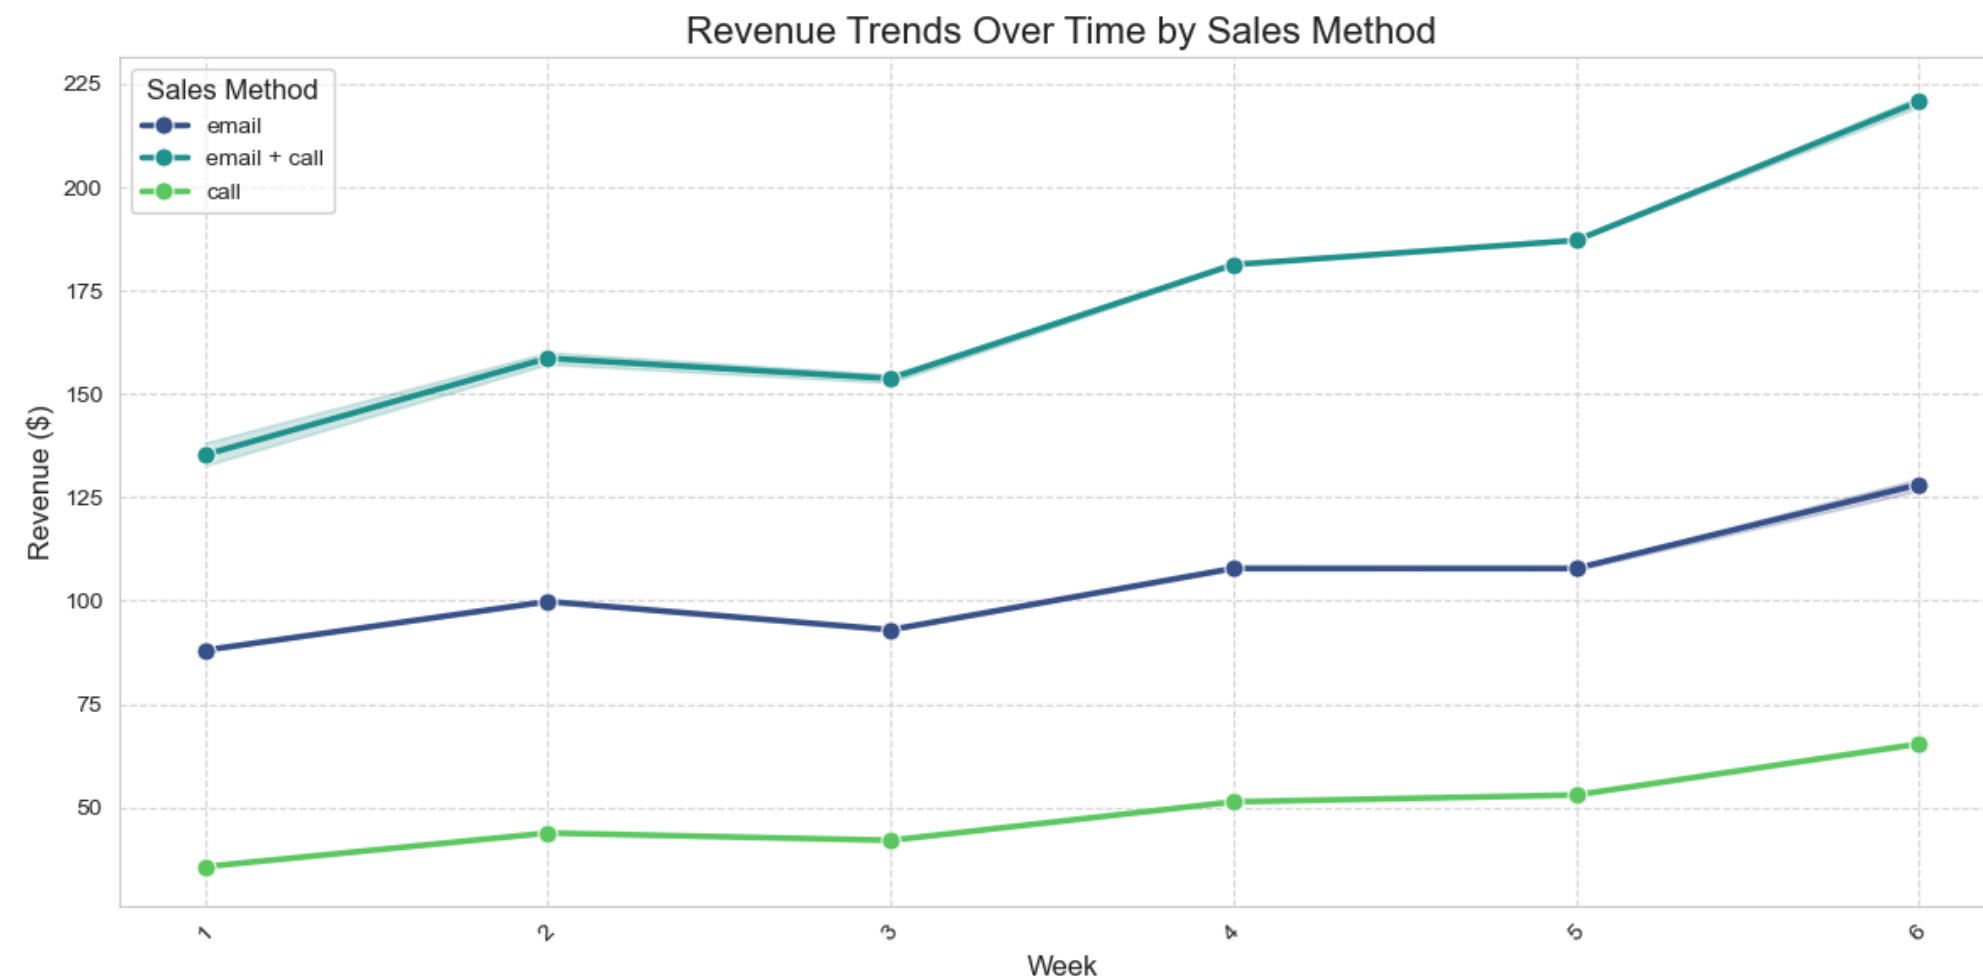

The distribution of revenue indicates the presence of outliers in both directions. With an average revenue of ~\$95, we do have sales below ~\$52 (25th quartile) and above ~\$108 (75th quartile)

At sales approach level, we understand that the smaller sales originates from calls (~\$48 avg.), whereas large sales come from the email + call approach (~\$183 avg.)

Revenue Trend

How did revenue change during the campaign

Revenue has increased over time across all sales strategies. However, the revenue trend tell us a different story compared to clients preferences.

Email + Call not only generated on average more revenue over time, but it was consistently higher during the sales campaign.

In week 1 Email + Call avg. revenue was ~54% and ~279% higher than Email and Call respectively.

In week 6 it as ~72% and ~238% higher.

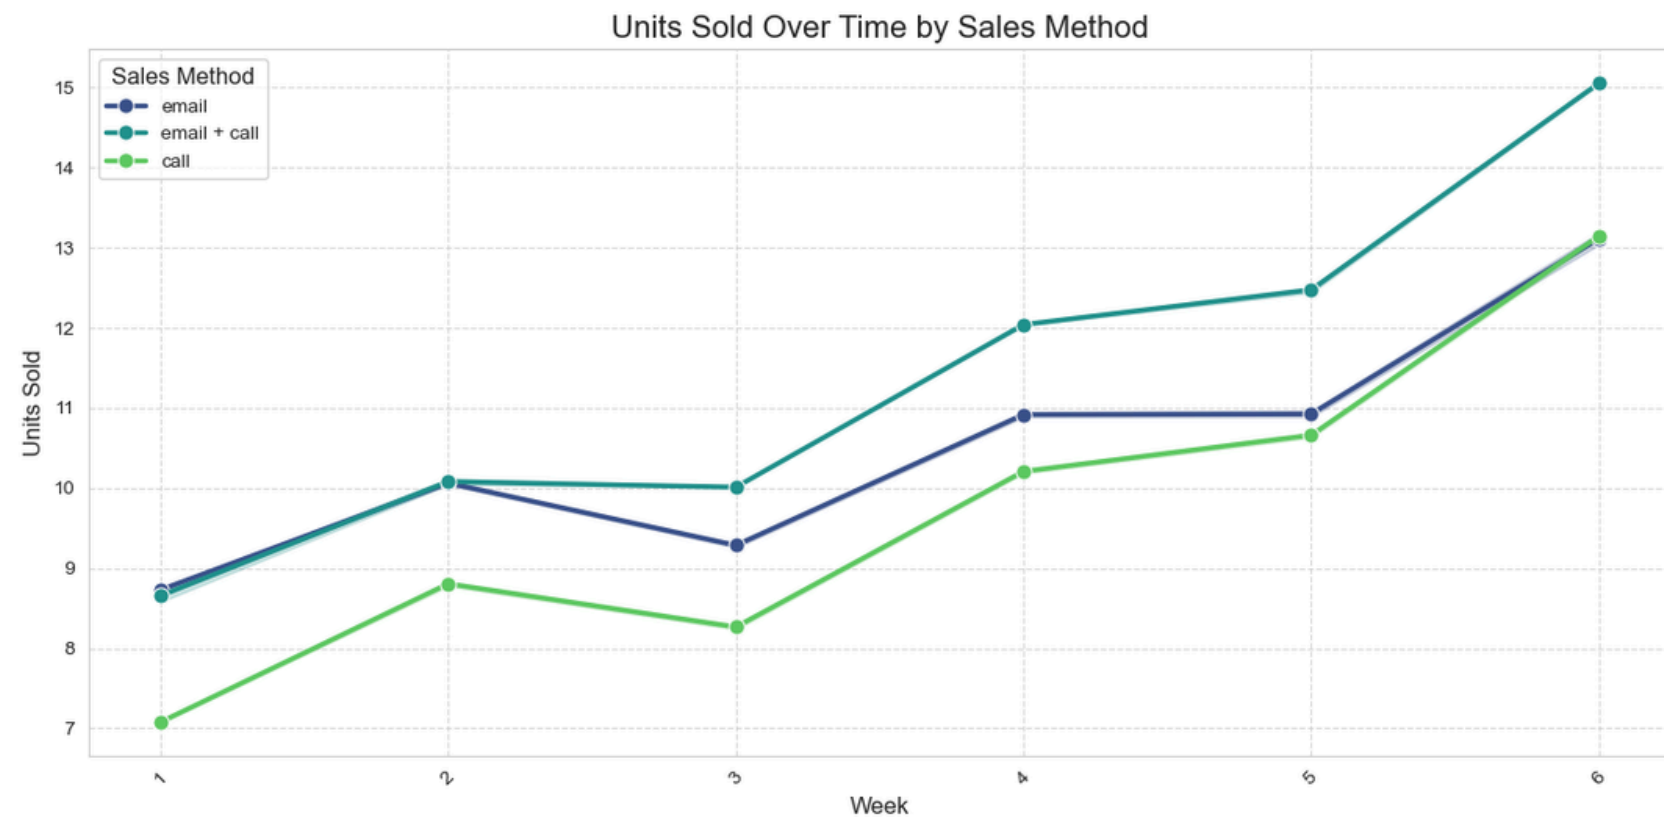

Relatively speaking, Email + Call revenue growth was consistent over time.

Revenue Breakdown

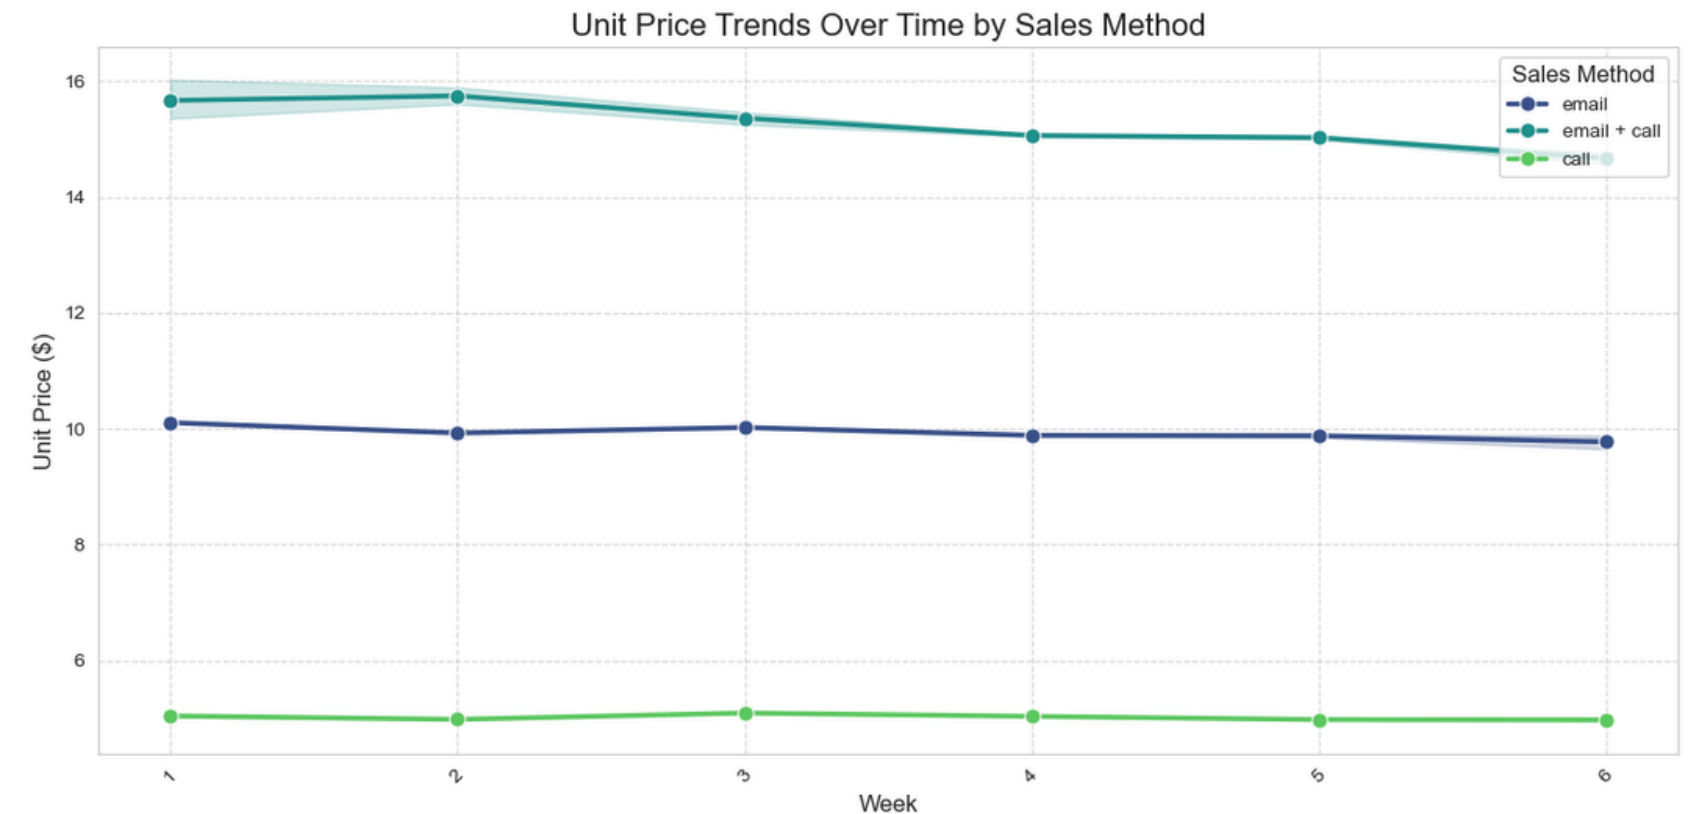

Units sold

Higher revenue is driven by sales volume.

Email + Call in week 6 sells 15% more items that Email and Call sales strategies

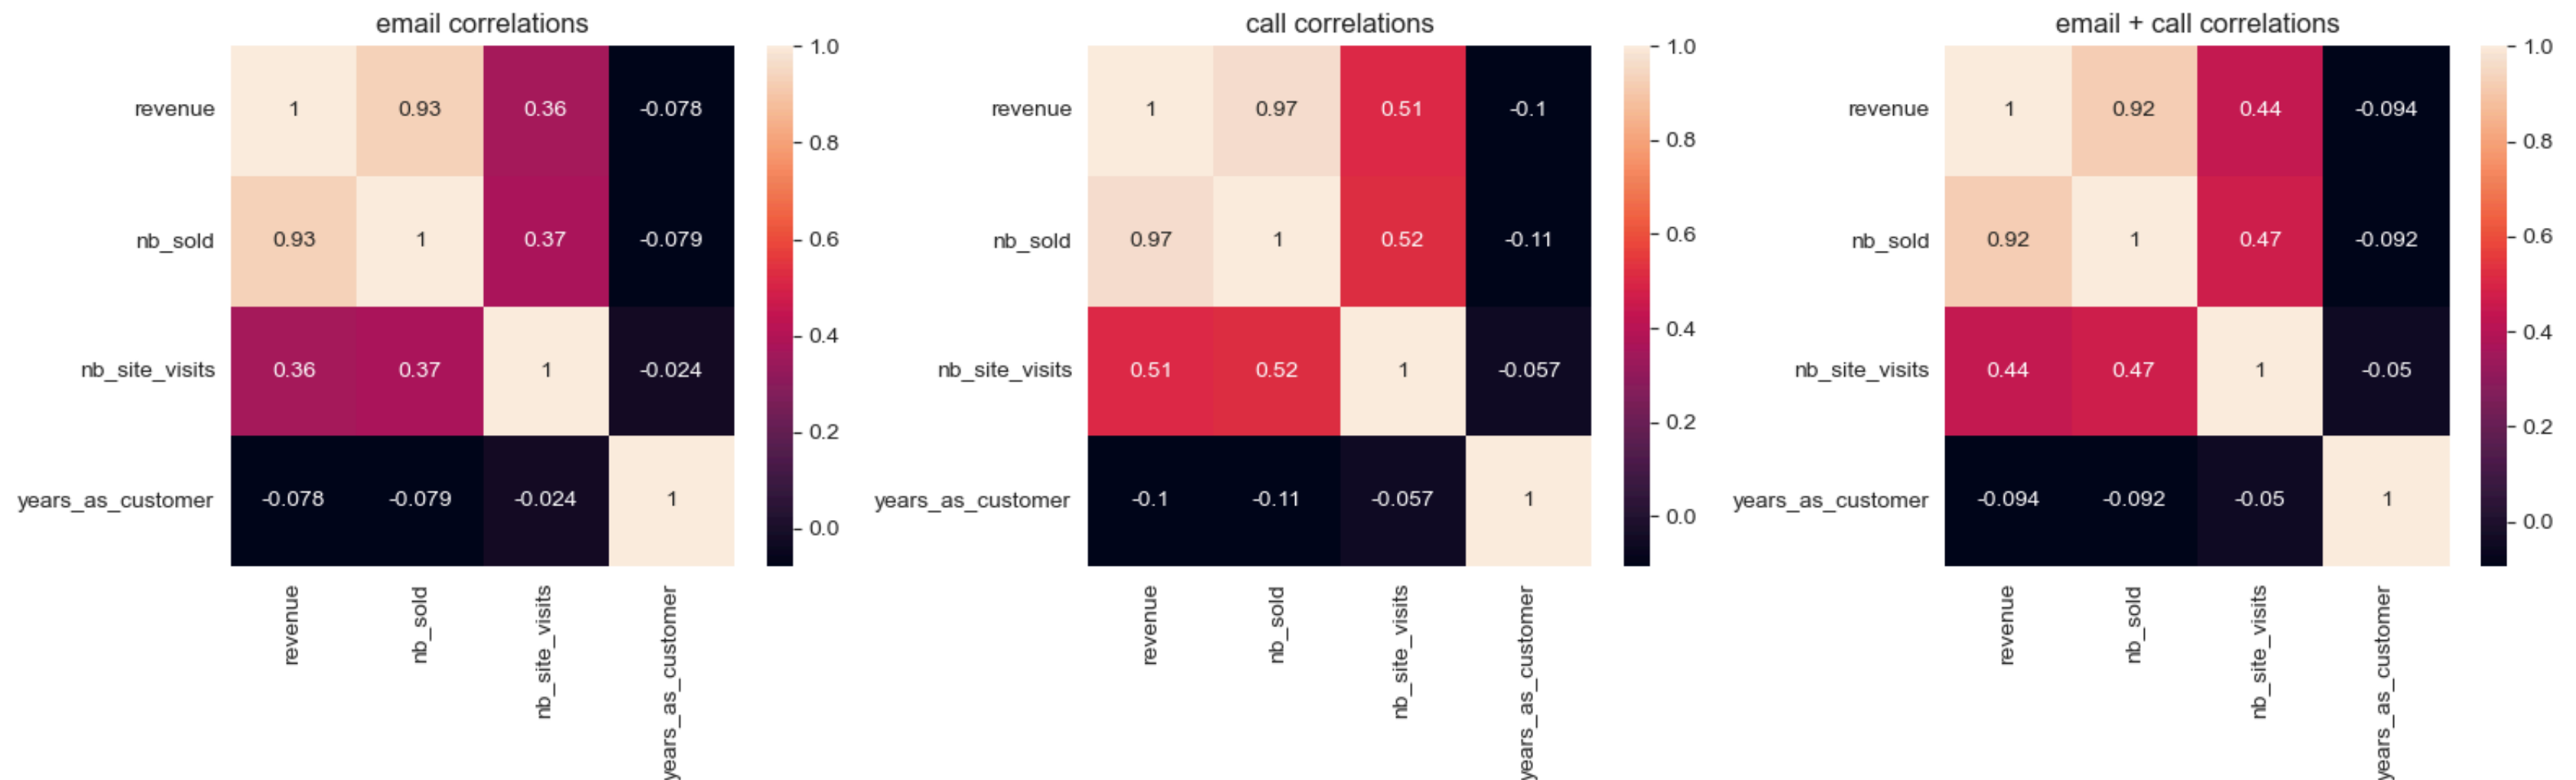

Unit price

The unit price story confirms the revenue trend and sales volume data. Clients prefers to make more expensive items purchases when we email and call them

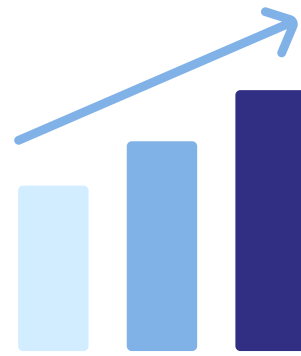

Customer Tenure and the Web

Can we learn anything from our customer base and website traffic?

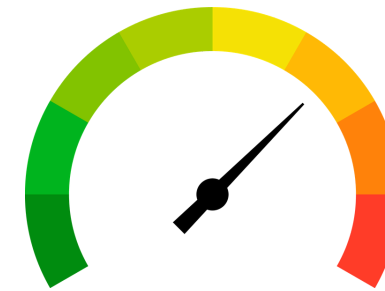

There is not significant correlation between variables such as revenue vs. client tenure, or revenue vs. website visits. We investigated correlations by each sales approach, but we haven't detected any pattern to be able to say that one approach is "superior" to the others.

For the future

Metric

Data from the past sales campaign show that revenue was driven by sales volume. This is the reason we recommend to track **Average Items Sold** going forward.

Baseline value

50% of total total revenue in week 6 was coming from Email + Call. On average this strategy was selling 15 items, therefore we believe that **any number above 30 items will indicate a sign of achieving sales targets** going forward.

Recommendations

Based on the observations from the sales campaign we have a few more general recommendations

- Consider Email + Call as single sales strategy. It generates more revenue, larger tickets sales, and it is relatively easy to implement.
- Track Average Units Sold for the success of future campaigns.
- Website traffic seems to have mild positive impact on revenue and units sold. Keep the website updated and with the latest prices.
- Consider using emails to redirect clients to the website.
- Validate categorical data to guarantee consistency with non-equivocal values.
- Make revenue and/or unit price mandatory items.
